

Working on this project made me realize how small design choices can have a big impact on accessibility. I **fixed all the color contrast issues**, making text readable for users with low vision or color sensitivity, and I **improved keyboard navigation including pressing enter to search**, so people can use the site entirely with a keyboard. I also **touched up smaller contrast and visual clarity issues**, **made link text more descriptive**, and **strengthened focus styling where it felt subtle**, which makes it easier for users to see where they are and interact with the site. For future accessibility, I **added better screen reader labels** for the favorite buttons and will add **transcripts and captions if media is added later**, so the site will continue to be usable for all users. Making these changes showed me that accessibility isn't just a technical requirement it's about making the site inclusive and usable for everyone
